

Supplementary Table 1. Results from univariable Poisson models of involuntary hospitalizations' frequency and meteorological parameters. Each meteorological parameter entered as current day value, lagged value (best lag model shown) or average of lagged values (± 1 , ± 2 , or ± 3 days around best lag value; shown only if better than best lag model). Meteorological parameters entered as natural cubic spline (3 knots). % relative change represents estimated change in frequency of involuntary hospitalizations for an increase of 1 interquartile range and assuming a linear effect on the log transformed frequency of involuntary hospitalizations. Ten lowest AIC (Akaike Information Criterion) values shown in bold and 10 highest absolute values of % relative change shown in bold/italic font.
